RECALLGRAPH

PITCH BRIEF / OCT 2026

The evidence-reconciliation workbench
for food-traceability investigations

Turn fragmented records into a trace people can inspect, challenge and explain.

THE PROBLEM

When a supplier flags a lot, a quality manager needs to find the batches it entered, the customers they reached, and where the records disagree.

Evidence can be spread across receiving notes, batch sheets and dispatch records with inconsistent lot codes or quantities.

HOW IT WORKS

1 Ingest supported records
2 Extract candidate claims with local Llama + parsers
3 Ground claims and flag unverifiable values
4 Human reviews relationships
5 Trace confirmed scope, possible exposure, gaps and findings

CORE PRINCIPLE

AI proposes. Source evidence grounds what can be checked. Humans decide. Deterministic tracing keeps confirmed scope separate from possible exposure.

7	53.1 s	13	8 of 13
authored scenario docs	one extraction run	AI candidate facts	quote at cited line

RUN 3 - OBSERVED OUTCOME

Relationship proposals: 8 generated; 7 confirmed by a reviewer; 1 false-positive dispatch link rejected.

Confirmed trace: finished lot FL-1021A and customers Bosveld + Highveld. FL-1034C was excluded after rejection. RM-O873 remained deferred, not merged.

Mass balance: 320 kg received vs 180 kg recorded consumed, plus 6,600 units downstream -> insufficient data; no unsupported unit conversion.

IMPORTANT CAVEATS

48 facts remained unreviewed at fact level in this run.

Four of the eight quote-verbatim spans did not contain the extracted raw value itself; the value was on an adjacent line.

Single authored scenario. No customer validation, accuracy rate, manual baseline or time-saving result measured.

WHAT IS NOT YET ESTABLISHED

- Reliable on independently supplied business documents
- Faster than manual recall reconstruction
- Better than existing platforms
- ERP integration, OCR for scans/images, production-grade identity/RBAC

THE ASK

We are seeking food-safety / quality practitioner feedback, authorised or redacted test records, and a supervised mock-recall comparison against the manual workflow.

RecallGraph assists investigation. People remain responsible for food-safety decisions. This prototype is not a compliance, certification or operational food-safety decision tool.

Prepared from the Run 3 benchmark reported 17 Oct 2026. Input documents are authored fiction; no customer data.
